

Welcome to InvestIQ

AI-powered financial model intelligence for infrastructure investment teams

InvestIQ addresses four structural problems in infrastructure investment: analysis cycle time (3-5 days to rebuild a scenario), model opacity (access restricted to the model author), fragmented risk signals across systems, and manual report production consuming 30-40% of investment manager time.

Analysis cycle time 3-5 days to rebuild a scenario	Model opacity Access restricted to the model author	Fragmented risk signals Signals spread across systems	Manual report production Consumes 30-40% of investment manager time

Core capabilities

Model overview Upload Excel, auto-parse, health check, live KPIs	Sensitivity engine Live sliders, tornado chart, sensitivity & carbon tables, AI in 3 lines
Cash flow simulator P10/P50/P90, DSCR covenant, payback tracking	Monte Carlo engine Configure distributions, 5,000 trials, hurdle probability, VaR
Performance monitor Actuals vs plan, IRR reforecast, milestone RAG tracker	AI assistant Persona-aware chat - full model context, concise answers, sources shown
Report generator IC paper, board 1-pager, variance report - live data, instant	

Role-based persona system

Every AI output, chart label and report adapts to your role. Switch persona at any time using the strip at the top of every page.

- Investment Manager - full platform access - IRR drivers, sensitivity engine, model audit
- CFO - covenant monitoring, board reporting, cash flow management, capital structure
- Board Director - plain-English verdict, strategic risk, governance triggers - no jargon
- Financial Analyst - model audit, formula logic, assumption sources, data lineage
- Project Owner - milestone tracker, capex overrun, schedule risk

Modules in the application

Model overview

Upload your Excel model or use the built-in LNG sample. InvestIQ auto-parses all sheets, maps assumptions, runs a health check, and shows live KPIs.

- Upload any .xlsx DCF, project finance, or LBO model
- 6 KPIs update live: IRR, NPV, Payback, DSCR, Equity multiple
- Model health check flags hardcoded cells and formula integrity gaps
- Revenue and EBITDA trajectory chart updates with every assumption change

Sensitivity engine + AI analysis

The core daily tool. Drag any of 8 sliders - every KPI, table, and chart updates instantly. Hit "Analyse Impact" for a 3-line AI insight framed for your persona.

- 8 live sliders: WACC, throughput, utilisation, carbon, overrun + more
- IRR tornado chart - ranked by impact, updates per slider drag
- Full sensitivity table: -20% / -10% / base / +10% / +20% per variable with IRR range bar
- Carbon ETS table: \$0-\$200/t x throughput fee - IRR and NPV at every intersection
- AI analysis: 3-cell Signal | Driver | Action format

Monte Carlo simulation engine

Configure probability distributions for each variable. The engine runs configurable number of trials and reports IRR distribution, NPV histogram, and probability of beating the hurdle rate.

- Configure mean, standard deviation, and distribution type per variable
- Normal or log-normal distributions - correct for bounded variables like utilisation
- Runs 5,000 trials with progress indicator - takes ~3 seconds
- Reports P10/P50/P90 IRR, probability of hurdle breach, and value at risk
- Correlation matrix shows co-movement assumptions between variables
- IRR and NPV distribution histograms with hurdle rate marker

Cash flow simulator

P10/P50/P90 bands, DSCR covenant year-by-year, cumulative payback tracking. AI interprets the profile for your persona in 3 lines.

- Annual FCF bar chart - positive years green, construction negative years red
- P10/P50/P90 distribution bands based on current assumptions
- NPV probability histogram - base case highlighted
- DSCR by year with 1.25x covenant line - trough year flagged
- AI: 3-cell "Profile | Risk period | Monitor this" format

Performance monitor

Post-FID: capex actuals vs plan, IRR quarterly reforecast, 8-milestone RAG tracker with variance and threshold alerts.

- Capex actuals vs plan - live chart, actuals plotted against approved budget
- IRR reforecast to complete - quarterly trend vs base and hurdle
- 8-milestone tracker: plan date, actual, cost variance, RAG status
- Alert badges fire at 7% overrun (board escalation) and DSCR < 1.35x

Report generator

IC papers, Board 1-pagers, and variance reports generated from live model data in 1 second. Persona-framed, tone-configurable, exportable.

- IC paper: executive summary, investment rationale, returns, risks, recommendation
- Board 1-pager: plain English, no jargon, headline-first format
- Variance report: actuals, schedule status, risk watch items, management actions
- Audience and tone settings: IC / Board / Lenders / Regulators
- All reports use live model values - change a slider and regenerate

Technical architecture

Technical Architecture Diagram of Investment & Capital Decision Intelligence Application

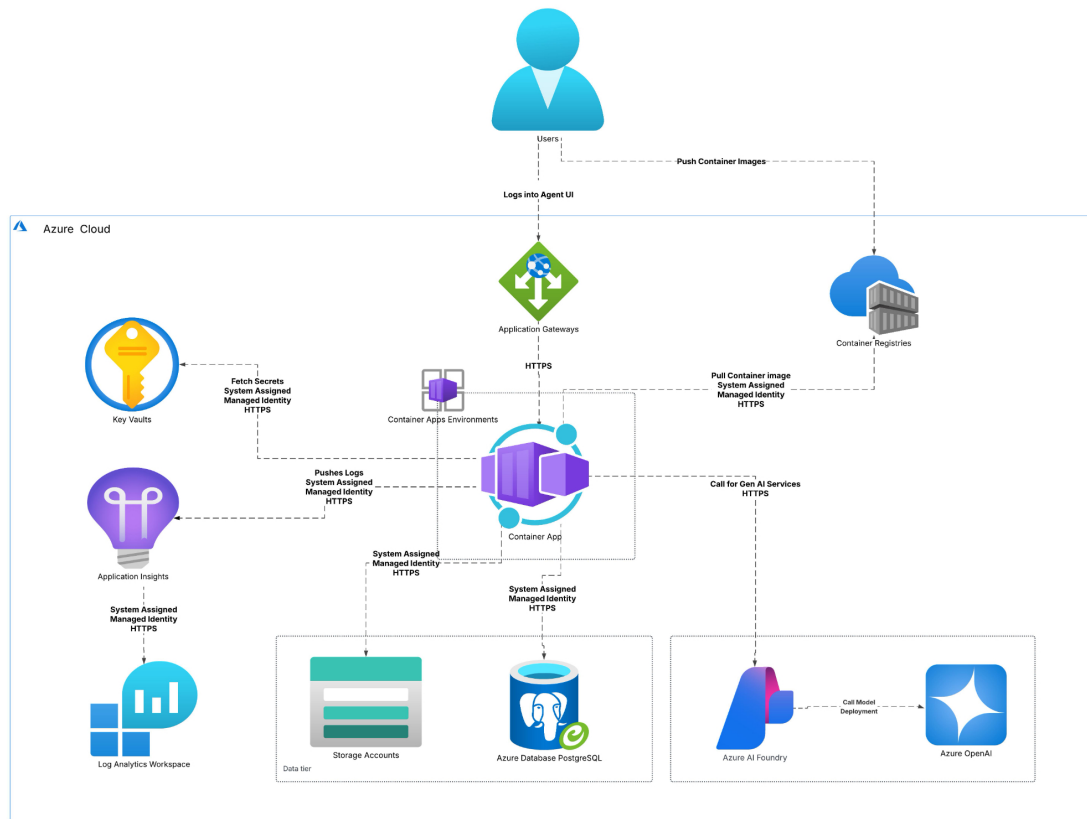

Diagram explanation

- Users log into Agent UI.
- Traffic enters through Application Gateways.
- The application runs in Container Apps Environments with a central Container App.
- Container Registries store container images, which are pushed and pulled over HTTPS.
- Key Vaults are used to fetch secrets through System Assigned Managed Identity.
- Application Insights collects logs, which flow into Log Analytics Workspace.
- The data tier includes Storage Accounts and Azure Database PostgreSQL.
- For AI capabilities, the Container App calls Azure AI Foundry.
- Azure AI Foundry connects to Azure OpenAI through a model deployment call.
